Research Interests

My research focuses on methods, tools, and theories for the construction of manageable, reliable, efficient, configurable, and evolvable software systems. In particular, I am interested in:

- **Programming methods** (feature orientation, generative techniques, modularity)
- **Software engineering** (variability, evolution, feature interactions, domain-specific optimization)
- **Empirical methods** (program comprehension, organizational structures, neuro imaging)
- **Formal methods** (program algebra, type systems, program analysis)

Furthermore, I am interested in how human and organizational factors influence software projects and vice versa, giving rise to a notion of **socio-technical software engineering**. For evaluation, I apply my research results to real-world systems from different domains, in particular, **distributed, data-intensive, high-performance computing, and embedded systems**.
